

Take good care of the cooling system

- change to a new impeller every season!

REPLACEMENT INTERVALS

- Johnson Pump impellers are long lasting but knowing the operating conditions could be harsh for this vital safety component we recommend replacement yearly or between 500hrs to 1000hrs depending on type, whichever comes first.
- Lubricate with Johnson Pump impeller lubricant, optimize the priming ability and avoid dry running at first start or after seasonal storage.

AGEING & STORAGE CONDITIONS

- Rubber is an ageing material, and the ageing process is depending on temperature, light and airflow. Ideally rubber should be stored cool and dark in a sealed plastic bag.
- Johnson Pump impeller kits provides protection from light and airflow.
- Storage condition should preferably be below room temperature. Recommended storage time from manufacturing until the impeller is put into operation is 5 years – to safeguard the ability to bend the vanes millions of times.
